WELCOME TO THE “PEOPLE’S UNIVERSITY,” ROGER WILLIAMS PARK, PROVIDENCE, RI FOUNDED: JUNE 1896

Our mission is to steward and interpret natural and cultural collections through exhibits, education and research to inspire people of all ages and cultures to enjoy the natural world, in order to better understand themselves and the world. The Museum of Natural History is Rhode Island's only natural history museum and is home to the state's only public planetarium. For more than a century the museum has served as a unique educational, scientific and cultural resource by offering exciting exhibits and programming that provide ways for children and families to learn about our world and its people.

Annotations:

Desktop

- Top Bar:
 - Nav Bar: I added this as a main menu area so that users would know where to look for decisive action to another page.
 - Sliding wall of images: I don't have other images yet because it was hard finding some but this serves as an aesthetic view of the site so that people can see visually what the museum is all about
 - Intro Section: I put the introduction to the site almost right at the top (or rather more in the center of the newly rendered page) so that users could look at the site and instantly be able to know where they are at and what is going on
 - Address and Times: I add this right under the intro so that users could instantly know how to engage with the museum in person in case that is all they need. this
 - Engagement or Membership, Volunteer and visit: I added the museum's 3 main ways for the public to engage with the museum in a row so that the user would be able to understand engagement better and have all the information organized for them
 - Calendar: I have the calendar under engagement so that the user can get more detailed information about what is going on at the museum and what type of events they can look forward to
 - Contact Info: I have contact information near the bottom as is the norm so that the museum can have people reach out to them directly.
 - I have an image next to the contact information for the museum as to balance the information out a bit and to give the user from information fatigue
 - I also added a caption so that the user doesn't get confused regarding the image
 - Lower Bar: Social media and copy right information is at the very bottom in the same color and form as the top nav bar so that the user knows you are at the end of the page.

Overall, I tried to condense the repeated information on the old page while organizing it to be clearer and more intuitive to navigate. I used the sliding wall of images to anchor the page and increase engagement. I increased font sizes and used fonts that are readability, simple, fun, and approachable

Tablet

- The tablet layout is very similar to the desktop but since the width is a bit smaller I decided to make the address and hours information to be vertically oriented instead of horizontally oriented like on desktop as that seemed to be a very dense area of information. I also did the same with contact information and the captioned image but I decided the width was still large enough for most other things to remain as is after scaling the sizes of the fonts, buttons, and icons down.

Mobile

- The mobile layout is the most unique because, due to the significantly smaller width, I could not arrange multiple sections horizontally and made almost everything vertical even after scaling down the fonts, buttons, and icons. I also condensed the nav bar into the logo, search, accessibility and hamburger icon so that it would look aesthetically pleasing and now overwhelmingly dense. The hamburger menu has all the other tabs that were in the navigation bar.

Other questions

- For larger containers, I am not sure if I will be using flexbox or grid but I believe that flex is the best way to make the information present well and accessible across various devices.
- When in-between sizes, I will most likely be scaling down fonts and adjusting margins so that the information is not skewed dramatically.
- I'm not sure if I will enable page changes for a click action because making my design dependent on other sites may cause problems down the road if a site is deactivated. I will have inverted buttons for hover. That said, being about to add that functionality would make my redesign look cool. I'd most likely do it by using <a> tags in my html.
